Market & Financial Snapshot

NIDA NUMBERS & CORE CONCEPT

CORE CONCEPT

NIDA is a **WhatsApp-first intent routing platform** for urgent home services in Qatar. Consumers send a request through WhatsApp and AI dispatches the job to the best provider.

Example interaction:

"AC repair needed in West Bay."

The system extracts intent, ranks providers, and dispatches the job.

MARKET PAIN vs. NIDA ECONOMICS

Current acquisition model used by service businesses relies on advertising on platforms like Meta, leading to high waste and low intent.

Current Market

Cost per qualified lead	100-250 QAR
Advertising waste	70-80%
Monthly ad spend	2,000+ QAR
Lead quality	Inconsistent

NIDA Economics

Cost per qualified lead	7-15 QAR
Advertising waste	~0%
Customer acquisition	Intent-based

Made with Replit

Most leads are unqualified or irrelevant.

InterfaceWhatsApp message

Consumers declare intent → AI matches → provider accepts.

SUBSCRIPTION MODEL

Service providers pay a monthly subscription. One completed job typically pays for the entire subscription.

TIER	PRICE	TARGET
Starter	150 QAR/month	Solo technicians
Growth	400 QAR/month	Small companies
Premium	800 QAR/month	Established providers

FINANCIAL PROJECTIONS

REVENUE GROWTH PROJECTION

Period	Businesses	Requests/mo	Revenue
Week 5	40	140	1,500 QAR
Month 3	80	500	12,000 QAR
Month 6	180	1,200	40,000 QAR
Month 12	400	3,000	105,000 QAR

YEAR 1 TARGETS

Total revenue840,000 QAR

Paying businesses

Monthly requests

Made with Replit

3,000+

Net margin

~95%

Infrastructure costs are extremely low because the platform runs primarily on messaging and AI automation.

Functionality & Competition

MARKET POSITION & CORE ENGINE

STRATEGIC MARKET POSITION

Current service platforms in Qatar (Syaanh, Aldobi, Home Hero Qatar) operate as **search marketplaces**. Instead of browsing listings, NIDA introduces **intent routing**—automatically connecting the consumer with the best provider.

Typical Marketplace

Search → browse → compare → negotiate.

Consumers want resolution, not options. Searching creates friction for high-urgency needs.

NIDA Model

Message → AI match → provider accepts.

Resembles dispatch systems like Uber, tailored for urgent home services (e.g. AC repair).

PLATFORM COMPARISON

FEATURE	NIDA	TYPICAL MARKETPLACE
Consumer interface	WhatsApp messaging	Website / mobile app
Service request	Natural language	Form-based
Matching	AI intent extraction	Manual browsing
Dispatch	Sequential best-match	Multiple providers contacted
Consumer effort	One message	Search + compare

MATCHING ALGORITHM

Providers are ranked for each request based on a weighted scoring algorithm:

Category match	30%
Location zone	25%
Price fit	15%
Capacity	15%
Trust score	15%

TRUST SYSTEM

The Trust Score (15% of match weight) is calculated using:

Customer ratings	40%
Response rate	25%
Completion rate	25%
Account age	10%

Automation Layer

Businesses can configure AI agents to automatically accept j rules (category, price, zone, timing), enabling 24/7 automated operations.

Made with Replit

LONG-TERM INFRASTRUCTURE

NIDA is built on **NOMOS**, a programmable governance protocol that allows service transactions to be structured as machine-readable agreements.

- 01 Automated dispatch
- 02 AI negotiation
- 03 Agent-to-agent commerce

Current Platform Capabilities

INTENT ROUTING & AUTOMATED DISPATCH

NIDA is a **fully operational intent routing platform** for local services, built around messaging-first interaction and automated dispatch.

CONSUMER INTERFACE

Consumers request services through WhatsApp.

- text messages
- photos or videos of the issue
- voice notes

Example request:

"AC repair needed in West Bay."

The system automatically interprets the request and initiates service dispatch.

Consumers receive updates including:

- provider assigned
- service confirmation
- job completion notifications

AI INTENT ENGINE

 Made with Replit

The platform uses natural language processing to convert messages into structured service requests.

Extracted attributes include:

service category	geographic location
urgency level	time preferences
budget signals	

If required information is missing, the system asks follow-up questions.

PROVIDER NETWORK

Service providers maintain structured profiles containing:

service categories	service zones	pricing ranges
availability	qualifications	

THIS DATABASE FORMS THE SUPPLY LAYER

DISPATCH ENGINE

NIDA routes service requests using an automated ranking system. Requests are dispatched **sequentially**.

The highest ranked provider receives the request first. If declined or unanswered, the system moves to the next provider.

This eliminates the lead spam common in traditional marketplaces.

TRUST & AUTOMATION LAYER

The platform continuously evaluates provider reliability. Higher trust scores result in more frequent dispatch priority.

Automated Rules

Service providers can configure rules to operate continuously without manual intervention:

- accept within defined service zones
- accept above a specified price threshold

Made with Replit

→ accept within working hours

NOMOS PROTOCOL INFRASTRUCTURE

NIDA operates on the NOMOS coordination protocol, which structures service requests as machine-readable agreements.

programmable dispatch rules

automated trust scoring

AI-assisted negotiation

agent-to-agent coordination

NIDA integrates messaging, AI intent extraction, automated dispatch, trust scoring, and programmable service agreements into a single platform.

Consumers simply send a message.

The system coordinates the service automatically.

Why NIDA Is Inevitable

THE SHIFT FROM SEARCH TO INTENT

"Consumers are not looking for information. They are looking for **resolution**."

The internet has historically organized services around search. Consumers must search, browse, compare, contact, and negotiate.

This workflow made sense when websites were the primary interface. But consumer behavior has changed. Messaging platforms such as WhatsApp have become the dominant interface for everyday coordination.

People increasingly ask instead of search.

THE EVOLUTION OF SERVICE PLATFORMS		
Early internet	Websites	Search directories
Marketplace era	Mobile apps	Listing marketplaces
Next gen	Messaging	Intent routing

WHY THE TIMING IS RIGHT

Made with Replit

Three technological shifts make this model possible now:

Shift 01

Messaging-First

Messaging has replaced websites as the primary coordination layer. WhatsApp alone serves billions of users globally.

Shift 02

AI Intent Extraction

Natural language systems can now reliably interpret unstructured requests into structured service requests.

Shift 03

NOMOS Contracts

Service transactions become machine-readable agreements, enabling automated dispatch and AI negotiation.

THE NOMOS ADVANTAGE & NETWORK EFFECTS

Without NOMOS:

NIDA functions as a marketplace.

Marketplaces connect buyers and sellers.

With NOMOS:

NIDA becomes a coordination protocol.

Protocols enable machines to coordinate transactions automatically.

Over time, this allows AI agents representing consumers and businesses to transact directly through structured rules.

The Data & Trust Moat

NIDA becomes stronger as usage grows, creating a moat that competitors struggle to replicate.

More consumers → more intent data

More providers → faster dispatch

Made with Replit

Higher matching accuracy & trust

NIDA

NIDA-05

Category Creation

FROM MARKETPLACES TO INTENT INFRASTRUCTURE

Most service platforms compete in the same category: Service marketplaces. This model improved discovery but did not solve service coordination. Consumers still manage the process themselves.

THE CATEGORY NIDA CREATES

Intent Routing Platforms

Instead of browsing providers, consumers simply declare their need.

The system interprets the request and automatically routes the job to the most suitable provider.

The platform becomes a dispatch system for services, resembling the operational logic used by Uber in transportation.

User Behavior:

"They no longer browse. They ask."

THE MONOPOLY OPPORTUNITY

 Made with Replit

The strongest companies dominate new categories, not crowded markets.

If positioned as:

"another home services app"

It would compete with dozens of platforms in a crowded market.

If positioned as:

The default interface for requesting services

Then it controls the demand gateway. Owning demand is the most powerful position in any marketplace.

THE PLATFORM FLYWHEEL

Demand → Supply → Data → Better Matching

More Consumers

More Requests

More Providers

Faster Fulfillment

More Transactions

Better Trust Scoring

Over time, the platform becomes the default coordination layer for services.

POSITIONING SUMMARY

CONSUMER LAYER

Urgent home services via WhatsApp.

MARKET CATEGORY

Intent routing platform for services.

Made with Replit

INFRASTRUCTURE LAYER

Programmable service coordination powered by NOMOS.

**"Search marketplaces help people
find providers.
Intent routing platforms help people
solve problems instantly."**
